## ACRONYMS

ACM – Asbestos Containing Material  
cm<sup>2</sup> – Square Centimeters  
DMSA – Department of Energy Material Storage Area  
DOE – Department of Energy  
dpm – Disintegrations Per Minute  
**EPA** – Environmental Protection Agency  
ft<sup>2</sup> – Square Feet  
ft<sup>3</sup> – Cubic Feet  
HP – Health Physics  
IH – Industrial Hygiene  
Lbs – Pounds  
LLW – Low Level Waste  
NCS – Nuclear Criticality Safety  
PCB – Polychlorinated Biphenyl  
PEL – Permissible Exposure Limit  
RCRA – Resource Conservation and Recovery Act  
RFD – Request for Disposal  
SME – Subject Matter Expert  
SWMU – Solid Waste Management Unit  
TLV – Threshold Limiting Value  
TSCA – Toxic Substance Control Act  
USEC – United States Enrichment Corporation  
U<sub>235</sub> – Uranium 235

## EXECUTIVE SUMMARY

Department of Energy Material Storage Area (DMSA) C-331-15 is located on the ground floor near the east wall of the C-331 process building (columns N31-32/BB3 1-32). It occupies approximately 5,200 square feet ( $\text{ft}^2$ ) of space. It is also classified as Solid Waste Management Unit (SWMU) #249. The area has been used as a storage site for excess electrical, maintenance and process equipment. Numerous types of materials such as wood and plastic items, scrap metal, fan blades, trashcans, work benches, transport carts, valves, supplies, etc. were stored in the DMSA. A tank labeled "lube oil" and a tank used for cooling tower maintenance were also identified. In addition, **48** B-25 type boxes containing miscellaneous materials were stored in the DMSA. The volume of material in the DMSA was estimated to be approximately 12,000 cubic feet ( $\text{ft}^3$ ). Characterization activities in the DMSA were initiated in June 2001 and completed in August 2001. Subsequent work activities were initiated in the DMSA in July 2002 to address concerns regarding burnable material in the C-331 facility. To reduce the fire loading within the building, repackaging of burnable and other materials occurred. Large storage containers such as B-25, 7A Type A and **ST-90** boxes were used to consolidate previously characterized material. The repackaging activities were completed in August 2002. All of the material originally identified in the DMSA remains within the DMSA with the exception of Resource Conservation and Recovery Act (RCRA) hazardous wastes and Toxic Substances Control Act (TSCA) polychlorinated biphenyl (PCB) and asbestos wastes. These wastes were transferred to C-752-A, C-746-A or C-733 RCRA permitted storage facilities. One other exception was three pieces of equipment returned to the United States Enrichment Corporation (USEC) for use. Information pertaining to these wastes and items is provided in the subcategories below. Photographs were taken of DMSA items as well as general views of the area prior to and after the characterization and repackaging program. Several of these photographs are included in this report. This DMSA was originally classified as a Phase 2 DMSA since it was known to contain one fissile or potentially fissile item and the material in the DMSA had not been fully characterized. Upon evaluation of radiological data, it was determined that the potentially fissile item contained less than one gram of  $\text{U}_{235}$  and was, therefore, Nuclear Criticality Safety (NCS) exempt. The DMSA was then reclassified as a Phase 1 DMSA (no fissionable or potentially fissionable items have been identified and the materials have not been fully characterized). Upon completion of the DMSA characterization program, it was recommended that the area be classified as a Phase 3 DMSA since all materials have now been fully characterized and no fissionable materials are present.

### RCRA/MIXED

Numerous light bulbs, circuit boards and fuses were found in the DMSA. An electronic tube and a tube of epoxy were also identified. In addition, oils drained from a Welch pump, an induction motor and a vacuum pump were characterized as hazardous waste. Since these wastes were also radiologically contaminated, they were classified as RCRA/Mixed. RCRA hazardous wastes are identified when discovered as either "newly discovered" or "newly generated" wastes. Newly discovered wastes are those hazardous wastes which are found loose or not installed in equipment such as aerosol cans, a tube of epoxy or a light bulb lying on the floor. Newly generated wastes are hazardous wastes which must be removed from equipment (such as circuit boards) or oil drained from a pump. The tube of epoxy, the electronic tube and seven of the light bulbs were classified as newly discovered. The remaining hazardous wastes were classified as newly generated. These classifications are noted on the "Waste Removed from DMSA C-331-15" section of this report. As items were characterized and classified as hazardous, they were packaged, labeled and transported to the C-752-A RCRA permitted storage facility. The tube of epoxy was transported and stored at the C-733 RCRA permitted facility, which is designated for storage of ignitable waste.

### TSCA-PCB/ACM/MIXED

Numerous capacitors (~41) were classified as TSCA regulated PCB waste. An induction motor and the oil drained from the motor were also classified as PCB waste. The oil was also classified as hazardous waste. All of these wastes, with the exception of the motor, were packaged, labeled and transported to the C-752-A RCRA permitted storage facility. The motor was stored at the C-746-A facility. Asbestos containing materials (ACM) were also discovered in the DMSA. These materials consisted of an asbestos gasket, cloth, insulation and asbestos wrapped motor coils. These materials were abated and transferred to the C-752-A

facility. Since all of these wastes were radiologically contaminated, they were also classified as "mixed" waste.

#### LLW

All of the material remaining in the DMSA was classified as low-level waste (LLW). The TSCA regulated and the RCRA regulated wastes were removed to RCRA **permitted** storage areas as they were identified and characterized. A large volume of the **LLW** was packaged in metal storage containers. There are approximately **71 B-25**, **7A** Type A or **ST-90** boxes of materials stored in the DMSA. Consistent weights and volumes were utilized in this report for those containers as follows: B-25 box = 96ft<sup>3</sup> and 500 lbs, **7A** Type A box = **110 ft<sup>3</sup>** and **750** lbs, and **ST-90** box = **110 ft<sup>3</sup>** and **1,000** lbs. These boxes remain in the DMSA. The waste types varied: wood, plastic, metal, and a combination of materials. The large containers were used primarily to package burnable and scrap metal items. Other **LLW** was stored in smaller containers such as 5 or 55-gallon **drums** or on pallets. All equipment and items were given barcode identification for future inventory control and equipment location reference.

#### NCS

A 12" valve assembly located in the DMSA had been characterized as potentially fissile prior to the current DMSA characterization project. Further evaluation of the analytical and nondestructive assay (NDA) data by NCS personnel determined that the item could be reclassified as NCS exempt due to the insignificant mass of U<sub>235</sub>. No additional NCS concerns were identified.

#### USEC MATERIAL

Three pieces of equipment were returned to the United States Enrichment Corporation (USEC) utilizing the requirements of the Paducah DMSA Material Transfer form. These items were a 450-volt breaker, an air compressor motor assembly and a diesel day tank with hand pump and motor.

#### IH

All Industrial Hygiene (**M**) data have been reviewed. All quality control samples were within normal acceptable guidelines. No personnel were exposed to any airborne concentrations above a permissible exposure limit (PEL) or threshold limiting value (TLV).

#### HP

The Health Physics (HP) surveys conducted included smears, direct readings and air samples. According to the radiological survey results, the highest total alpha contamination was **17,794** disintegrations per minute (dpm) per **100** square centimeters (cm<sup>2</sup>). This reading was from a **G-17** valve subassembly. The highest total beta/gamma reading was **460,051** dpm/100cm<sup>2</sup> from an equipment buggy.

#### SAFETY

There were no safety related events during the characterization program. Pre-job briefings were held with all entry and support personnel to ensure that individual responsibilities and authorities were understood. A safety officer was in attendance during all phases of work to evaluate conditions and provide safety related input to workers. All workers had stop work authority to ensure unusual or unexpected events were evaluated before work was allowed to proceed.
