EXECUTIVE SUMMARY

Department of Energy Material Storage Area (DMSA) C-400-05 is located near the center of the C-400 Chemical Operations facility at columns C7-13/D7-13. It occupies approximately 12,500 square feet (ft^2). It is also identified as Solid Waste Management Unit (SWMU) #351. DMSA C-400-05 contains abandoned equipment that was used for three different and distinct functions in the past. The "test loop" was used to test the performance parameters of "000" size process equipment. It used uranium hexafluoride (UF_6) as a test agent to assure actual plant operating conditions. It was placed in operation in the late 1950's and operated for approximately 10 years. The converter conditioning facility was used to achieve final operating flow conditions for newly fabricated converters. This was accomplished by circulating a reactive gas through the converters to alter diffusive flow characteristics to the desired level. This facility utilized both "00" and "000" size converters. It ceased operations after the C-409 conditioning facility initiated operations in the early to mid 1970's. The third facility operation was the pulverizer. It was used to reduce the particle size of various uranium salts/compounds. This reduction enhanced the chemical reactivity of the material by increasing its surface area. The system was placed in permanent standby in the late 1980's or early 1990's. Parts of these three systems, which are designated as in standby condition and awaiting future decontamination and decommission (D&D) activities, are still connected to utilities which interface with United States Enrichment Corporation (USEC) operations. In addition to the above described functions/systems, the C-400-05 DMSA was used for storage of miscellaneous equipment/material and supplies. Examples of these include three 55-gallon drums of UF_4 (reusable), vacuum cleaner parts, pumps, traps, mops and buckets. Numerous Resource Conservation and Recovery Act (RCRA) hazardous wastes were identified within the DMSA. The hazardous wastes were classified as either "newly generated" or "newly discovered". This classification is discussed in greater detail in the RCRA section of this summary. Recycling and offsite disposal of some of the materials and RCRA wastes in the DMSA are also discussed in that section. Additionally, Toxic Substance Control Act (TSCA) polychlorinated biphenyl (PCB) capacitors and ballasts as well as several asbestos containing materials (ACM) were identified. These regulated wastes are further discussed in the pertinent sections of this summary. The waste within the DMSA had a volume of approximately 3,674 cubic feet (ft^3) with an estimated weight of 50,310 pounds (lbs). The reusable material had a volume of approximately 607 ft^3 . The material/equipment identified for decontamination and decommission had an estimated volume of 63,382 ft^3 . Field activities in the DMSA were initiated in October 2001 and completed in November 2003. Closure of the RCRA Satellite Accumulation Area (SAA) occurred in June 2003. Future determinations may be made on wastes and materials which could change their classification and/or disposition. This DMSA was originally classified as a Phase 2 DMSA. The DMSA will remain a Phase 2 due to fissionable materials being present in the DMSA. Photographs were taken of the area and many of the individual items in the DMSA during the characterization program. Several of the photographs are included in this report.

RCRA/RCRA MIXED

RCRA hazardous wastes are identified as either "newly discovered" or "newly generated". Newly discovered wastes are those hazardous wastes which are found loose or not installed in equipment. Examples of this waste type are aerosol cans and light bulbs lying on the floor. Newly generated wastes are hazardous wastes which must be removed from equipment (such as circuit boards) or drained from equipment (such as oil). Both of these classifications were found in DMSA C-400-05. The classifications of newly discovered or newly generated are noted on the "Waste Removed from DMSA C-400-05" section of this report. Some of the types of hazardous wastes found were: circuit boards, light bulbs, fuses, vacuum tubes, aerosol cans and a mercury manometer. A small volume of nitric acid and oil drained from equipment were also identified. The liquid in a five gallon container (RFD #112358) was characterized and classified as RCRA hazardous/mixed; however, the sampling and analytical processes consumed all of the material. The samplers documented that there was approximately 1.9 liters of liquid in the waste container prior to sampling. The samplers poured material from the drum into sample containers. Sampling notes document that there was an insufficient volume of material in the waste container to meet the sample volumes requested for specific parameters. This required splitting of the samples in the laboratory to ensure receipt of the requested analytical data. The waste container met the RCRA definition of empty since "the waste was removed using the practices commonly employed to remove material from the container (e.g., pouring...and no more than one inch of residue remained in the bottom of the container)".¹ As items/wastes were characterized and classified as hazardous, they were packaged, labeled and stored in an SAA or transferred to a RCRA permitted storage facility. The SAA was established on October 10, 2002, and closed on June 6, 2003, when wastes in the SAA were transferred to a RCRA permitted storage facility. In December 2002, the Department of Energy (DOE) provided guidance for the recycling of circuit boards which are not radioactively contaminated.² These circuit boards are not considered hazardous waste since they meet the scrap metal being recycled exclusion in 40 CFR Part 261.4 (a) (13). Numerous circuit boards from C-400-05 met this criterion. These circuit boards were classified as nonhazardous and shipped offsite on February 18, 2003, to Advanced Environmental Recycling Company (AERC) in Allentown, Pennsylvania. The recyclable circuit boards are indicated (Recy) on the DMSA C-400-05 Inventory Report, the Initial Inventory and Characterization Report and the Recycle/Disposal Inventory. The hazardous wastes in the DMSA which were radiologically contaminated were classified as RCRA Mixed wastes. Some of these wastes were shipped for disposition on May 6, 2003, to Envirocare of Utah Incorporated located in Clive, Utah. Numerous RCRA nonradiological wastes that were not recycled were shipped to AERC for disposition on February 18, 2003, and to Chemical Waste Management Incorporated (CWMI) in Emelle, Alabama, on October 23, 2002. A small volume of RCRA waste was shipped to CWMI on August 18, 2003. Disposition of wastes and recyclable materials from C-400-05 is identified on the Recycle/Disposal Inventory of Materials and RCRA Wastes from DMSA C-400-05 in this report.

¹ 40 CFR Part 261 "Identification and Listing Hazardous Waste" (261.7(b)(1)(i)(ii))

² Seaborg, W. Don December 21, 2002, Site Manager, Department of Energy, Paducah Site Office, letter to Robert H. Daniell, Division of Waste Management, Kentucky Department for Environmental Protection, Frankfort, Kentucky

TSCA-PCB/ACM

Numerous capacitors and three light ballasts were classified as PCB wastes. Since these wastes were radiologically contaminated, they were further classified as PCB/LLW.

These wastes were labeled, packaged and transported to the C-752-A RCRA permitted storage facility. Several ACM such as brake shoes/pads, insulation and cloth wrap were identified, packaged and labeled as asbestos LLW. Three lube oil systems in DMSA C-400-05 were characterized as containing detectable PCBs. The systems had detectable PCB labels attached. These systems were identified as D & D equipment.

LLW

The wastes remaining in the DMSA have been classified as low level waste (LLW). These wastes include a varied assortment of material types (wood, metal, plastic) and configurations. Examples of these wastes are: pans, pumps, mops, pallets, vacuum cleaners and parts, hoists, valves and carts. Several containers of chemicals such as sodium fluoride, soda ash and uranium oxyfluoride were also identified. Small metal parts were consolidated into larger containers such as 55-gallon drums or ST-90 boxes. Rubber, paper and plastic items were handled in a similar manner.

NCS

Several drums of metal dust were handled as Nuclear Criticality Safety (NCS) controlled items. These containers were transferred to C-746-Q. A bag of metal parts and valves was identified as fissile NCS spacing controlled and is managed in a Fissile Control Area (FCA) within the DMSA. In addition, a reusable AC-92 pump has been identified as fissile and is managed as a spacing controlled item in an FCA within the DMSA. Three systems associated with the AC-92 pump are also managed in FCAs as NCS spacing controlled. These systems are: a panel of pneumatic instruments, the conditioning stand and the jet air exhaust system. Several BOP actuators having an assay of greater than one (1) weight percent were evaluated and classified by NCS personnel as NCS exempt.

REUSABLE MATERIAL

Approximately 607 ft³ of material within the DMSA have been designated as reusable material. These items have been given unique "E" numbers. The items consist of assorted valves, motors, pipe fittings and compressor parts. Also included are miscellaneous washing machine and dryer parts and PVC piping. Three drums of UF₄ were also identified. The reusable items are identified on the C-400-05 Reusable Material Inventory in this report.

D&D ITEMS/SYSTEMS

Some of the systems in DMSA C-400-05 are still connected to plant utilities (i.e. pulverizer unit and conditioning stand). These systems and items/equipment which are connected and support these systems are identified as D&D items/equipment. They are given unique identification numbers (DD numbers). These materials will be handled in future D&D program activities. The items/systems are specifically identified in the C-400-05 D&D Inventory of this report.

IH

All Industrial Hygiene (IH) data has been reviewed. No personnel were exposed to airborne concentrations above the established permissible exposure limits (PEL) or threshold limiting values (TLV).

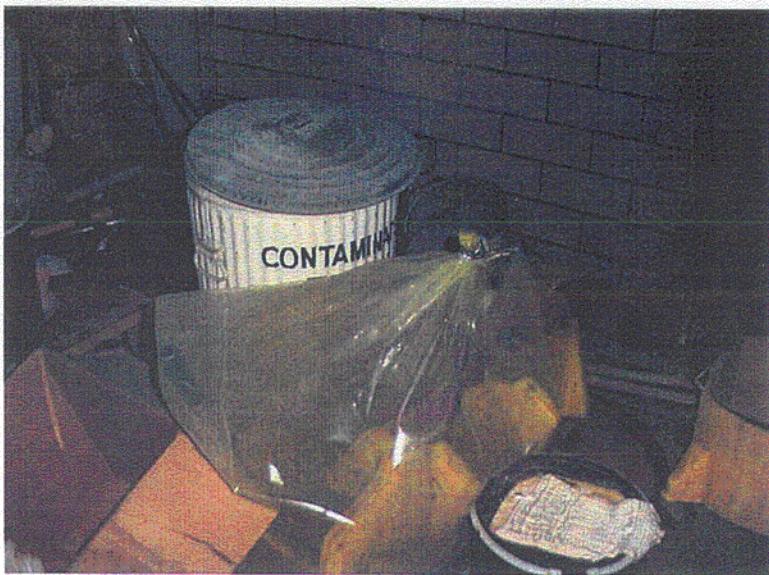

HP

Health Physics (HP) surveys which are conducted may include smears, direct readings and air samples. Air samples are normally taken only in contamination areas and/or when opening containers with unknown contents. The highest total alpha reading from the radiological surveys was 40,631 disintegrations per minute (dpm) per 100 square centimeters (cm^2). This reading was from a two inch flanged pipe. The highest total beta/gamma reading was 4.5 million dpm/100cm 2 . This reading was from a valve enclosed in a radiological bag.

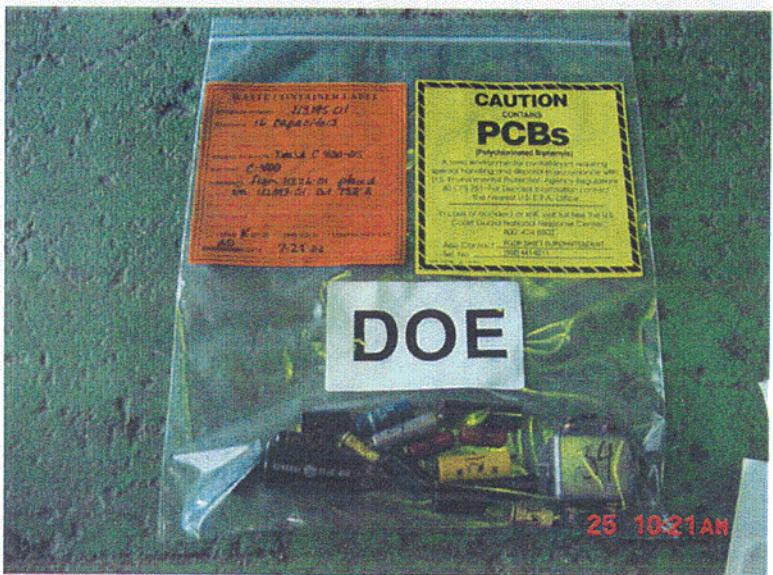

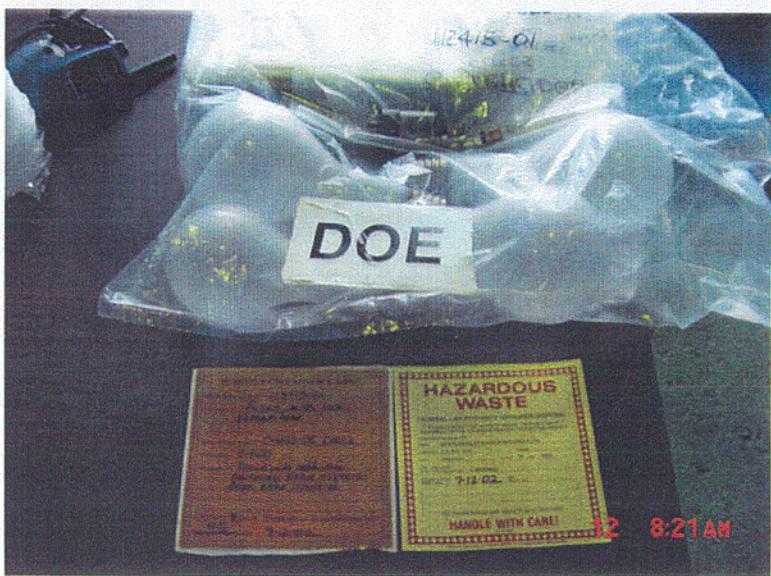

SAFETY

There were no safety related events during the characterization program. Pre-job briefings were conducted with all entry and support personnel to ensure that individual responsibilities were understood. A safety officer was in attendance during all phases of work to monitor conditions and provide safety related input to workers. All workers had stop work authority to ensure that unusual or unexpected events were addressed before work was allowed to proceed.
